Aluminum Detection Distance: 2 Times Previous Models

*In-house comparison of M18 Shielded Long-distance Models

Immunity against aluminum chips has enabled achieving long-distance detection of aluminum workpieces. The same detection distance has also been achieved for iron, allowing the E2V-X□ to be separated from workpieces made of either metal farther than any other Proximity Sensor.

Aluminum Excellent Performance, with Aluminum Chip Immunity!

Iron Also Detects Iron at Long Distances!

Detection Made Visible

An operation indicator that is visible from any direction is provided as a standard feature.

This indicator flashes under unstable conditions for easy installation condition verification at a glance.

Embeddable in Metal.

The first Long-distance Sensor that is shielded. Possible to be completely embedded in metal.

Other Information

Sensing Distance

- The sensing distance depends on the sensing object size, material, and thickness.
- If the sensing object has a thickness of less than 1 mm, the sensing distance will decrease.
- In some cases, it may not be possible to detect stainless steel. Use the following graph and the *Influence of Sensing Object Size and Material* information in *Engineering Data (Typical)* as a reference.

Aluminum and Iron Cuttings

Normally aluminum or iron cuttings will not be detected even if they adhere to or accumulate on the sensing surface. Detection signals may be output for the following. If this occurs, remove the cuttings from the sensing surface.

Diameter of cutting = d and diameter of sensing surface = D
Cuttings in center of sensing surface with $d \geq 2/3D$
